Connect to a service To connect to a service that you have installed and configured in the cloud, click the **Available Microsoft services** menu and select the service. This menu will not show the services that you have installed for Office 365, but it will show the services that you have registered as part of the Office 365 service in the cloud. **Figure 10-6** Using a service in the cloud If you only want to register the service in the cloud, click **Register**. The service will not appear in the **Available Microsoft services** menu. If you already have the service installed locally, you will see **Offline** next to the service in the **Available Microsoft services** menu. # Plan Your Workload The way that your computer uses resources is called `_workload_`. Every computer has a unique workload. Every computer is unique. Every computer is different. If you use too much of one resource—CPU, RAM, disk space, Internet bandwidth, and so on—you can slow down performance for other resources. Your workload might change as you install new software and add new hardware. It might change if you use different programs. It might change if you use email. It might change if you visit a website that has a lot of content to load. In this chapter, we'll look at how you can use PowerShell to plan your workload and then create a plan. We'll also look at a power user's favorite tools to plan your workload: Windows Server Manager and Task Manager. # How Do I Plan My Workload? You can use PowerShell to plan your workload. You'll learn how to use PowerShell to help you plan your workload. You can plan your workload: * To see which processes are using the most resources. * To make sure that the program or the Windows operating system is working with what it needs to do its job. * To make sure that you have all the programs that you need. * To understand how your computer uses resources. ## Planning Your Workload with Windows PowerShell In this section, we'll show you how to use Windows PowerShell to plan your workload. 82157476af
